Notes:

1. Operation in excess of any one of these conditions may result in permanent damage to this device. $T_A = 25^\circ\text{C}$ except for T_{ch} , T_{STG} , and T_{max} .
2. Minimum voltage on V_{G2} must not violate the following: $V_{G2}(\text{min}) > V_{DD} - 9$ volts.

Description

The HMMC-5021/22/26 is a broadband GaAs MMIC Traveling Wave Amplifier designed for high gain and moderate output power over the full 2 to 26.5 GHz frequency range. Seven MESFET cascode stages provide a flat gain response, making the HMMC-5021/22/26 an ideal wideband gain block. Optical lithography is used to produce gate lengths of $\approx 0.4 \mu\text{m}$. The HMMC-5021/22/26 incorporates advanced MBE technology, Ti-Pt-Au gate metallization, silicon nitride passivation, and polyimide for scratch protection.

Notes:

1. Small-signal data measured in wafer form with T_{chuck} = 25°C. Large-signal data measured on individual devices mounted in an HP83040 Series Modular Microcircuit Package @ T_A = 25°C.
2. Performance may be extended to lower frequencies through the use of appropriate off-chip circuitry. Upper -3 dB corner frequency ≈ 29.5 GHz.

Applications

The HMMC-5021/22/26 series of traveling wave amplifiers are designed for use as general purpose wideband gain blocks in communication systems and microwave instrumentation. They are ideally suited for broadband applications requiring a flat gain response and excellent port matches over a 2 to 26.5 GHz frequency range. Dynamic gain control and low-frequency extension capabilities are designed into these devices.

Biasing and Operation

These amplifiers are biased with a single positive drain supply (V_{DD}) and a single negative gate supply (V_{G1}). The recommended bias conditions for the HMMC-5021/22/26 are $V_{DD} = 7.0V$, $I_{DD} = 150\text{ mA}$ for best overall performance. To achieve this drain current level, V_{G1} is typi-

cally biased between $-0.2V$ and $-0.5V$. No other bias supplies or connections to the device are required for 2 to 26.5 GHz operation. See Figure 3 for assembly information.

The auxiliary gate and drain contacts are used only for low-frequency performance extension below $\approx 1.0\text{ GHz}$. When used, these contacts must be AC coupled only. (Do not attempt to apply bias to these pads.)

The second gate (V_{G2}) can be used to obtain 35 dB (typical) dynamic gain control. For normal operation, no external bias is required on this contact and its self-bias voltage is $\approx +2.1V$. Applying an external bias between its open-circuit voltage and -2.5 volts will adjust the gain while maintaining a good input/output port match.

Assembly Techniques

Solder die-attach using a fluxless AuSn solder preform is the recommended assembly method. Gold thermosonic wedge bonding with 0.7 mil diameter Au wire is recommended for all bonds. Tool force should be $22 \pm 1\text{ gram}$, stage temperature should be $150 \pm 2^\circ\text{C}$, and ultrasonic power and duration should be $64 \pm 1\text{ dB}$ and $76 \pm 8\text{ msec}$, respectively. The bonding pad and chip backside metallization is gold.

For more detailed information see HP application note #999, "GaAs MMIC Assembly and Handling Guidelines."

GaAs MMICs are ESD sensitive. Proper precautions should be used when handling these devices.
