## 3.3V / 5V ECL Differential Receiver/Driver with Variable Output Swing

### Description

The MC100EP16VS is a differential receiver with variable output amplitude. The device is functionally equivalent to the 100EP16 with an input pin that controls the amplitude of the outputs.

The  $V_{CTRL}$  input pin controls the output amplitude of the EP16VS and is referenced to  $V_{CC}$ . (See Figure 4.) The operational range of the  $V_{CTRL}$  input is from  $\leq V_{BB}$  (max output amplitude) to  $V_{CC}$  (min output amplitude). (See Figure 3.) A variable resistor between the  $V_{CC}$  and  $V_{BB}$  pins, with the wiper driving  $V_{CTRL}$ , can control the output amplitude. Typical application circuits and a  $V_{CTRL}$  Voltage vs. Output Amplitude graph are described in this data sheet. When left open, the  $V_{CTRL}$  pin will be internally pulled down to  $V_{EE}$  and operate as a standard EP16, with 100% output amplitude.

The  $V_{BB}$  pin, an internally generated voltage supply, is available to this device only. For single-ended input conditions, the unused differential input is connected to  $V_{BB}$  as a switching reference voltage.  $V_{BB}$  may also rebias AC coupled inputs. When used, decouple  $V_{BB}$  and  $V_{CC}$  via a 0.01  $\mu F$  capacitor and limit current sourcing or sinking to 0.5 mA. When not used,  $V_{BB}$  should be left open.

11. Measured using a 750 mV source, 50% duty cycle clock source. All loading with  $50\ \Omega$  to  $V_{CC} - 2.0\text{ V}$ .

12. Skew is measured between outputs under identical transitions. Duty cycle skew is defined only for differential operation when the delays are measured from the cross point of the inputs to the cross point of the outputs.

13.  $V_{PP}(\text{min})$  is minimum input swing for which AC parameters are guaranteed.
